QUINDOS Gear Gauges

The Package QUINDOS Gear Gauges is used to calibrate involute and lead masters on ultra high precision coordinate measuring machines.

Typical users of this option are governmental calibration laboratories (PTB in Germany, NIST in USA, CSIRO in Australia, NPL in UK and others) and the quality assurance departments of large companies.

The purpose of this option is the calibration of gear gauges used for the qualification/testing of gear testers. Therefore, only 3D measuring machines of the highest accuracy, such as the PMM-C 700 P, can be used with this option.

Gear measurement technology by Hexagon Metrology: fast, precise and cost-efficient!
